FLOW METERS

Water flow monitoring in open channels is widely employed in environmental and geotechnical field.

Leakage measurement is one of the most important indicator of the overall performance of earth/rock-fill and concrete dams.

The leakage rate is a function of the water level in the reservoir and depends either from the construction than the behaviour of the dam. Consequently, leakage monitoring provides data for the evaluation of the long term stability of the dam constructions.

Leakage water is usually impounded downstream of the dam and diverted to a basin in a weir-station.

APPLICATIONS

- Leakage measurement in concrete and earth dam
- Open channels flow rate
- Drainage systems in tunnels and excavations

FEATURES

- Suitable for both manual reading and remote monitoring
- Available both triangular and rectanguar notch plate
- Utilize high accuracy transducer
- Easy to automate with OMNIAlog logger family

CE *Meet the essential requirements of the EMC Directive 2014/30/UE*

OPERATING PRINCIPLE

Notched weirs operate on the principle that an obstruction in a canal will cause an hydraulic jump, creating a high level behind the barrier with a typical low water current (no turbolent motion). The purpose of the notched weir is to transform the water level in the upstream basin into instantaneous flow values of the canal where the weir is installed. To allow this, a specific formula is used: it considers that the flow rate is function of the notch shape and proportional to the water depth "H", called head.

For reliable measurements, the following conditions must be verified:

- the canal upstream will have a fair slope (1-3%) and rectangular section for a length of at least 10L (where L=width of canal);
- the measuring point of the water head "H" will be at a minimum distance of about 4H from the weir;
- be sure the air under the water which floods immediately after the weir, will be in contact with the barometric pressure (do not create a closed chamber);
- the possibility of solid materials being drawn by the current and deposited upstream of the measuring equipment will be kept in mind. Accumulated sediments may affect the reliability of measurements, so that sediments should be cleared regularly;
- water will be carried away from the weir in the downstream in order to not interfere with the notch.
